

Lecture 0: Class Setup

Raul Riva

FGV EPGE

Date Placeholder

Course Information

- **Course:** Econometrics I (Part I);
- **Instructor:** Raul Guarini Riva — `raul.riva@fgv.br`;
- **Teaching Assistant:** Taric Latif — `tariclatif@gmail.com`;
- **Class Schedule:** Tuesdays and Thursdays, 11:00–13:00;
- **TA Session Schedule:** check with Taric;
- GitHub repository: <https://github.com/rgriva/econometrics-fgv-2025>
- After class, you should review the online syllabus in detail;

We will use Github for course materials, assignments, and so on.

Why Should You Take This Class Seriously?

- Most students will engage in empirical research across diverse fields of Economics:
 - Labor, Development, Urban, Finance, Health, IO, even Macro...!
 - Obviously important if you want to do Econometrics;
- So far, most of what you learned is about **cross-sectional data** and **OLS**;
- We go beyond cross-sectional data to tackle: **Time Series** and **Panel Data**;
- Time Series data is your bread and butter in Macro, Finance, and many other fields;
- Panel Data methods (fixed effects, diff-in-diff, ...) are everywhere in empirical research;
- We will also cover a bit of non-parametric methods and bootstrap techniques;

Learning Goals (by Week 5)

After the first half of the course, you should be able to:

1. Understand and implement non-parametric kernel-based methods;
2. Apply bootstrap methods for i.i.d. data;
3. Analyze time series data:
 - Concepts: stationarity, ergodicity, persistence, autocorrelation, ...
 - Basics of ARMA models and VARs;
 - Impulse response functions;
4. Implement GMM estimation under heteroskedasticity and autocorrelation;
 - Super relevant for Panel Data methods;
 - Also very useful to estimate structural models;

Books? Slides?

- I will provide slides for the lectures;
- These slides will be mostly based on two books:
 - **Econometrics**, by Bruce Hansen (hello, old friend!);
 - **Time Series Analysis**, by James Hamilton (serious dark magic);
- I will highlight the recommended readings in the slides, and reading the books is **mandatory**.
- Slides are not a substitute for reading the books;
- I will make slides available on Github just before class;

Tentative Weekly Topics

- **Week 1:** Non-parametric estimation + Bootstrap for i.i.d. data;
- **Week 2:**
 - The structure of time series data, stationarity, ergodicity, persistence, autocorrelation, ...;
 - ARMA models + the Box-Jenkins methodology + Wold Decomposition;
- **Week 3:**
 - Estimation of ARMA models, MLE estimators...
 - LLN's and CLT's for dependent data – focus on using the results rather than proving every single little thing;
- **Week 4:**
 - VAR's, companion form, reduced-form vs structural VARs;
 - Impulse response functions and local projections;
- **Week 5: GMM**
 - GMM definition and asymptotic theory;
 - GMM and HAC estimation + numerical pitfalls;

Evaluation and Grades

- Grades for the first and second half of the class are independent;
- Final grade = $0.5 \times (\text{Grade on Part I}) + 0.5 \times (\text{Grade on Part II})$;
- The first part has 2 problem sets and 1 exam:

$$\text{Grade on Part I} = \frac{1}{6} \times \text{PS1} + \frac{1}{6} \times \text{PS2} + \frac{2}{3} \times \text{Exam} \quad (1)$$

Problem Sets

- You can work in groups of up to 3 students;
- There will be both theoretical and empirical questions;
- Problem set solutions must be submitted in PDF format through Github;
- Create a folder for you group under `student_work/name1_name2_name3/`. Please upload your work there;
- You should deliver both a report answering the questions and the code used to generate the results;
- Feel free to use any civilized programming language (Python, R, Julia, Matlab, ...);
- No, you cannot use Stata or pre-packaged solutions in any of the languages above – details will be provided in the problem sets;

Questions?

One more thing...

This is really important!

- This is the first time I teach this class;
- I need ongoing feedback;
- Is there something great about? Tell me! If there something terrible about it? Also tell me!
- Don't be shy – negative feedback will never be punished in any way;
- If anything, on the contrary!
